Cyberpunk 2077 VR Mod

Future Feature Roadmap

October 2026

Overview

This roadmap lists every feature currently under consideration for the mod, grouped by commitment level. Each entry includes a short description and any known technical dependencies, risks, or reasons for its placement. Abandoned items are kept on record with their reasoning.

Tier	Items	Meaning
Planned	**5**	Committed near-term work. These features are next in line for development.
Much Later (But Planned)	**6**	Committed features scheduled after the Planned tier.
Maybe	**5**	Under consideration. Not committed; depends on demand, feasibility, and effort.
Likely Never	**2**	Ideas recorded for completeness. Low value relative to risk or effort; unlikely to be built.
Abandoned For Cause	**5**	Explored and dropped. Kept here with reasons so they are not revisited without new information.

Planned

Committed near-term work. These features are next in line for development.

Feature	Description	Notes & Dependencies
Gesture Mode Reactions	Flipping off an NPC (middle-finger gesture) triggers combat if the NPC is a potential enemy type. Non-hostile NPC types respond with an angry expression instead.	Requires locating the native function that puts an NPC into combat. Likely a Ghidra hunt plus Cheat Engine testing, unless this data is already on hand or the RED4ext SDK has a bytecode example and header for it.
Controller Rumble for Weapon Hits	Haptic feedback on the controllers for gunfire and melee weapon hits.	First phase of haptics. Expanded coverage (honking, cyberware) is scheduled under Much Later.
Faster Gesture Mode Activation	Reduce the time needed to hold B to activate gesture mode from five seconds to two seconds.	Quick win; small tuning change.
Physical Walking	Headset (HMD) relocation in the real world drives V's actual in-game walking.	An implementation approach exists, but it is unclear whether current headsets can support it. May never ship; depends on how VR hardware evolves.
Steam Frame Controller Layout	A dedicated control layout for the Steam Frame controllers.	Its controls differ significantly from other VR controllers. It has more buttons to take advantage of and does not need the virtual D-pad that standard VR controllers require.

Much Later (But Planned)

Committed features scheduled after the Planned tier.

Feature	Description	Notes & Dependencies
Expanded Controller Vibration	Haptic feedback for shooting, honking, and cyberware attacks.	Builds on the weapon-hit rumble from the Planned tier.
Console Push Auto-Drive	Pushing into the center of the car console activates auto-drive, mapped to the L3 button.	—
Full Localization	Support every language Cyberpunk 2077 supports across the mod's menus and messages.	—
Laser Pointer LOD Fix	Keep the drawn laser line, and the points on it, from fading out through in-game LOD.	—
Cloud Save Synchronization	Ensure cloud saves stay synchronized.	—
Monowire Brightness Slider	Make the Monowire brighter where possible, with an adjustment slider.	Use the archive-based approach and apply it at launch. Far simpler than manipulating a variable in memory.

Maybe

Under consideration. Not committed; depends on demand, feasibility, and effort.

Feature	Description	Notes & Dependencies
KatWalk Integration	Support for KatWalk omnidirectional treadmills.	—
Virtuix Omni Integration	Support for the Virtuix Omni treadmill.	—
Physical Shotgun Pumping	Animate the shotgun pump rack so it can be physically racked in VR.	Large feature; would come much later than other items in this tier.
Remove HMG Crosshair	Remove the crosshair from heavy machine guns.	—
SteamVR / OpenVR Runtime Support	Add support for the SteamVR/OpenVR runtime alongside OpenXR.	OpenVR is legacy; even Steam recommends OpenXR. I have concerns that a second runtime could introduce slowness and confusion for players.

Likely Never

Ideas recorded for completeness. Low value relative to risk or effort; unlikely to be built.

Feature	Description	Notes & Dependencies
Native Game HUD	Use the game's actual HUD instead of the custom HUD layer, which copies the HUD onto a separate pane and overlays it.	Would require hooking the HUD panel before the game draws it and resizing it. Hooking that area risks null-pointer crashes. So far adds almost nothing to gameplay. May be tested later.
First-Time Setup Prompt	Track whether this is the user's first time using the mod. On first launch, a pop-up asks which hand mode they want (left or right), prompts them to calibrate VRIK settings and hand length, then shows where to find the settings menu.	Flag is saved to the settings file and can be toggled between first-time and not first-time in the Dev tab of the settings menu.

Abandoned For Cause

Explored and dropped. Kept here with reasons so they are not revisited without new information.

Feature	Description	Notes & Dependencies
Empty-Hands Fist Draw	Raise both fists to open the weapon wheel.	Built and tested; the experience was poor.
Braindance Mono Fallback	Automatically switch to mono rendering inside braindances to avoid stereo distortion artifacts.	Resolved by true VR projection and framelag fix, under which braindances look great. Would only return if players specifically want non-projection mode. Which let's get real, who would.
VRIK Gun Slots	Select guns using VRIK body slots and the number pad.	Concept did not hold up.
Third-Eye Scope Camera	Render a separate camera inside each scope so aiming zooms the scope view rather than bringing the scope closer to the eye.	Unnecessary. Scope zoom is controlled by a single value and the scope already produces a magnifying effect, so the extra GPU cost buys nothing.
Mod Organizer 2 (MO2) Compatibility	Support launching the mod through MO2.	Not feasible. MO2's virtual files are only injected when the original game is launched. Sidestepping this sacrifices the doorman (proper VR resolution) and the LOD fix, or causes the player's other MO2 mods to disappear for the session. Not supported.
